Flow measurement methods other than positive-displacement flowmeters rely on forces produced by the flowing stream as it overcomes a known constriction, to indirectly calculate flow. Flow may be measured by measuring the velocity of fluid over a known area. For very large flows, tracer methods may be used to deduce the flow rate from the change in concentration of a dye or radioisotope. Kinds ...

Using methods to estimate the dissipation for a specific body (such as solutions to equations describing the elastic deformation of layered spherical bodies; see Henning & Hurford 2014 and Tobie et al. 2019) is beyond the scope of this work wherein we simply want to perform a direct comparison of the impact of orbital corrections and dual-body dissipation when using robust rheological modeling.
